Operations runbook

> Demonstration package built from synthetic data.

Client: Demo Client · **Engagement:** DEMO-0006 · **Process owner:** [NAME] · **Backup:** [NAME]

1. What runs, and when

The wrapper `run_monthly.sh` is started by the scheduler at the time in `crontab.txt` (`0 7 6-10 * *`) on several days, because the feed may be late. It stops after the first successful run of the month. It reads the files from the data folder in `config.yaml`, checks them, builds the documents and prepares the email drafts. It never sends email.

2. Monthly routine (about 45 minutes)

1. Open the notification or `logs/`. Read the **release decision** at the top of the control sheet (`results_workbook.xlsx`, sheet Controls).
2. If the decision is RELEASE or RELEASE WITH NOTES: read the commentary, add analyst notes in `review/commentary_notes.yaml` if needed and run the report stage again (`make report`).
3. Send the exceptions queue to the data owner.
4. Open the email drafts in `distribution/`, check the recipients and attachments, and send them yourself.
5. Record the month in the ledger sign-off (the release gate result is stored automatically in `outputs/ledger.csv`).

3. Exit codes

Code	Meaning
0	Released: the report (with or without notes) is ready for review
2	HELD by the release gate: read the control sheet, fix the feed, run again
3	The month's feed has not arrived yet: nothing was produced; the scheduler tries again tomorrow
1	Failure: read the log (logs/run_*.log)

4. Controls: what each one means and what to do

Control	Effect	What to do when it is not a PASS
Feed complete (volume)	**Blocks the report**	A truncated or partial file: ask for a re-send. Do not release.
Lines match the sender's control total	**Blocks the report**	Compare the file with the sender's count; ask for a complete re-send.

Control	Effect	What to do when it is not a PASS
No duplicate lines	Note	The month was loaded twice: duplicates are removed automatically; tell the data owner.
Feed arrived	**Blocks the report**	Ask the data owner for the file; the job tries again tomorrow by itself (exit code 3).
Feed on time	Note	Note the delay; agree the sender's deadline again if it repeats.
Feed covers the whole month	**Blocks the report**	The file stops before the month end: ask for the missing days.
Budget loaded for every region	Note	Ask Finance for the missing target; the report shows no budget for that scope until then.
Exceptions queue small	**Blocks the report**	Send the exceptions queue (tables/exceptions_queue.csv) to the data owner to correct at source.
Product line mapped	Note	Ask the data owner to refresh the product mapping table.
Net revenue in line with recent months	Note	Look at the trend chart; confirm with the business that the movement is real.
Period unchanged since the last run	Note	A month already reported has changed: tell the readers of the earlier report.

5. Recovering from problems

- **Feed late or missing:** do nothing; the scheduler retries every day of the window. After the last day, call the data owner.
- **Report HELD:** read `blocked_by` in the control sheet. Fix the cause at source, put the corrected file in the data folder and run `python -m reporting_automation.pipeline --config config.yaml --period YYYY-MM`.
- **A past month changed (restatement):** the report says so and shows the change; inform the readers of the earlier report.
- **Run failed (exit code 1):** read the last lines of the log. The usual causes are a changed column name in the file (update `data.column_map`) and a full disk.
- **A new region, product line or KPI:** add it to `data.regions` / the KPI catalogue in `config.yaml`; run the tests (`make test`); do not edit the code.

6. Changing the process

Thresholds, blocking controls, KPI formulas, the schedule and the recipients are in `config.yaml` and the recipients file. Any change is a change request in writing; re-run the parity check after a KPI change.
